Why UWB communications?

- Transmitter: Low power, simple.
- More energy efficient than narrow band: $C = B \log_2 \left(1 + \frac{S}{N}\right)$.
- Multipath = copies of signal = more received energy (narrow band: constructive / destructive interference).
- Not sensitive to problems at distinct frequencies:
 - Interference from other sources.
 - Channel attenuation.

(c) Typical indoor received signal, clear line-of-sight.

Figure: Multipath.

UWB-IR PHY

- Based on PHY proposal for IEEE 802.15.4a (WPAN Low Rate) by Time Domain.
- The idea: Use sampling principle from radar for symbol detection. Operate in stochastic resonance region.

January 2005
